Esteticor New Start®
Instructions for use
Palladium-based metal alloy for metal-ceramic dental restorative systems

Mixing of different alloys or alloys of similar types is not allowed!
Wear darkened eye protection and protective gloves when melting.
Protect eyes, hands and breathing during pickling.
Protect eyes and breathing during processing with rotating instruments with an aspirator device.

With the publication of these instructions of use all previous editions are no longer valid.

The manufacturer refuses any liability for damages due to disregard of the instructions for use below.

General instructions for use

Modelling
Usual modelling technique for ceramic fused to metal works.
Minimal wall thickness 0.4 mm. With bridgework the connections must have a minimum section of 6 – 9 mm². Modelling of garlands or inlay shaped reinforcements in the palatinal region will give added stability. The application of air and cooling vents improves casting results.

Investing
The following investments are recommended for this type of alloys:
CM Ceramicor (phosphate based, containing graphite).
CM-20 (based on quartz and cristobalite without graphite for the rapid preheating technique).
Plaster-based investments are not suitable for this type of alloy.

Re use of alloy
Only use perfectly cleaned (by sandblasting with aluminium oxide) buttons and sprues and add at least ⅓ of new alloy.

Traceability of lot numbers
If different lots of an alloy are being used for the realisation of a restoration, all lot numbers concerned must be noted in order to assure traceability.

Surface quality of cast objects
In order to prevent corrosion the cast object must have a surface free of shrink holes and porosities after trimming and polishing.

Cooling of castings
Do not quench the casting cylinder after casting, but bench cool to room temperature. Removal of oxide layers Oxides due to firing or soldering can be removed by sandblasting. Gilding of frameworks Gilding is carried out at the users own risk.

Polishing
After the last firing free metal surfaces must be polished to a high shine in order to completely remove the oxide layer. Disinfection Each prosthetic restoration must be cleaned and disinfected before try in or definite insertion in the mouth of the patient.

Further information
On processing precious metal alloys, soldering and casting-on are included in the Dental documentation of Cendres+Métaux and in the website www.cmsa.ch/dental.

Allergies
With patients having an existing allergy to one or several elements contained in any one alloy, this particular alloy must not be used.
With patients suspected of having an allergy to one or several elements contained in any one alloy, this alloy can only be used after preliminary allergological testing and proof of a non existing allergy.

The products carry the CE sign. See packaging for details.

ISO 22674 / ISO 9693

Indications

- a: Inlays, onlays
- b: Single crowns
- c: Short-span bridgework
- d: Long-span bridgework
- e: Milled work
- f: Clasps, lingual bars, palatinal plates

The use of solders not mentioned in the table is subject to the user's risk. In case of uncertainties, consult the instructions of the manufacturer involved.
