# V-Delta® Special

## Instructions for use

**Medium-Gold dental Alloy for Porcelain bonding, extra hard, white, type 4**

### Indication

Substructures for porcelain-to-metal, crowns and bridges, C&B technique, suprastructures on implants, milling works.

- Single crowns
- Long-span bridge-work
- Short-span bridgework
- Milled work

### Physical properties

**Composition in weight %**

<table>

<tbody>
<tr>
<td>S.G 750</td>
<td>695 – 750 °C</td>
</tr>
</tbody>
</table>

* The values indicated result from measurements obtained under exactly defined conditions. Individual deviations of ± 10 % are possible and to be considered as normal.

### Preventive measure (contraindication) and important notes

These instructions for use must be precisely followed. It has been suggested in specialized literature that some of its components can, in extremely rare cases, have allergy effects. The choice of the material is the decision of the practitioner based on his knowledge of the sensitivity of the patient.

**Corrosion resistance and biocompatibility**

V-Delta® Special has been submitted to the following tests:

- Corrosion resistance according to ISO 22674
- Cytotoxicity test according to ISO 10993-5
- Sensitization test according to ISO 10993-10
- Mutagenicity test (AMES) according to 10993-3

The alloy is considered to be highly corrosion resistant and showed neither a cytotoxic nor a mutagenic potential nor did it cause any allergic sensitization.

**Launch year 1998**

V-Delta® Special corresponds to the standards EN ISO 22674 / EN ISO 9693

V-Delta® Special has been manufactured according to the quality standards ISO 9001 / ISO 13485.

**Rx only**

The products carry the CE sign. See packaging for details.
**Melting**

It is important, when using a torch for melting (for inst. *Meteor type «O»*) that the recommended propane (approx. 0.5 bar or 7.25 psi) / oxygen (approx. 1.0 bar or 14.5 psi) mixture and pressure are observed. Before melting add a pinch of flux to the alloy. Once the alloy has completely melted, continue heating for a further approx. 5 sec. before releasing the casting machine arm. When melting by induction or resistance heating, the power must be maintained for an additional approx. 5 sec.

Flux: boric acid

**Cooling**

Bench cool the casting ring.

**Devesting/Cleaning**

Clean by blasting with glass beads or pure aluminium oxide (Al₂O₃) particle size (50 μm to 125 μm) at 1.5 to 2.0 bar (21.7 to 29 psi) pressure.

**Pickling**

Following casting or soldering, the frame at room temperature may be pickled in hot Desoxid for at least 2 min. – Desoxid I (75 %).

**Finishing**

Trim the framework first preferably using carbide burs and then fine grinding points at low speed. Blasting is done using pure aluminium oxide (approx. 110 μm). Recommended grinding points: Cerasiv Brown (5'000 – 10'000 rpm) Pressure: 1.0 – 2.0 bar

**Cleaning**

Frameworks must be cleaned preceding oxidation either in boiling water for 10 min. (distilled water is recommended) – in an ultrasonic unit for 5 min. – or with a steam cleaner.

**Gilding (Aurofilm® 2000)**

The application of a gilding layer of Aurofilm is possible according to the instructions for use. Aurofilm should be fired in a ceramic oven. Firing temperature: 920°C – 940°C

**Oxidation**

10 min. without vacuum to 950°C and bench cool. The framework should have a uniform grey appearance.
Porcelain application

Porcelain or resin applications are subject to the manufacturers instructions. The alloy is compatible with most known porcelain brands. Consider the CTE of the alloy in conjunction with the cooling recommendation of the porcelain manufacturer. Paste opaques should be pre-dried for approx. 10 min. before firing at manufacturers recommendation.

Pre-drying temperature: 300 °C – 400 °C.

Excellent results have been obtained with the following porcelains (in alphabetical order), with a normal cooling cycle: Ceramco II, Creation &, Duceram, Duceram Plus, Finesse, IPS Classic, MagicCeram, Omega, Omega 900, Super Porcelain EX-3, Symbio Ceram, Synspar, Vintage, Vintage Halo

Excellent results have been obtained with the following porcelains (in alphabetical order), with a slow cooling cycle: dSign, VMK-95

To avoid greening of the porcelain, which can occur in the use of the alloy a number of anti-greening products from porcelain manufacturers are available. Regard the respective instructions.

A solution to avoid greening altogether is to use a surface treatment with Aurofilm® 2000. Graphite supports are best used to protect the muffle during firing providing a diminishing deterrent against possible greening. It is recommended to purge the furnace using a graphite rod, at approximately 1000 °C for 20 min. under vacuum.

Soldering/Laser

We recommend using a propane/oxygen torch (Meteor Type «L») for soldering and a flux like Fluxor. During soldering wear dark goggles for protection. The design of the soldering block is a compromise between minimising its thermal mass whilst retaining sufficient strength to avoid its fracturing during soldering. Leave a parallel gap of 0.1 – 0.2 mm between surfaces to be soldered and sufficient area to ensure adequate strength of the joint.

Laser welding wire: LW No. 3

Heat treatments

Self-hardened by slow (bench-) cooling of the casting ring

Hardened 600°C/15 min. – let bench-cool

Polishing

The oxide layer may be removed in Desoxid. Thorough rubber-wheeling ensures easy polishing. For best prepolishing results, soft brushes, felts and cotton wheels are employed using Legabril Diamond diamond-paste. «Whiting chalk» (chalk-powder) mixed with water on soft brushes or cotton wheels may be used for final high polish.
